Education

FPT Academy (Aptech), Advanced Diploma in Software Engineering – Ho Chi Minh City, Vietnam

2023 – 2026

- Graduated with Distinction (84.25/100)

Projects

Groundwork | [Live Demo](#) | [Source](#)

July 2026 – Present

Personal Project

- Built a full-stack AI document workspace with FastAPI, React, and PostgreSQL/pgvector that ingests multiple document formats, extracts and chunks content, and stores embeddings for semantic search.
- Ran document ingestion, OCR extraction, and AI generation as background jobs using Celery and Redis, supporting per-job cancellation; deployed the FastAPI backend to Google Cloud Run and React frontend to Render, using Supabase PostgreSQL/storage and managed Redis.
- Implemented citation verification that cross-checks generated claims against stored document page records, strips phantom citations, and blocks ungrounded content from export.
- Enforced workspace-scoped data isolation with automated checks that scan the codebase for violations, backed by 102 Pytest tests plus Vitest and Playwright E2E suites running through GitHub Actions.

VeriSpend | [Live Demo](#) | [Source](#)

Apr 2026 – June 2026

Personal Project

- Built a multi-tenant expense review platform in ASP.NET Core and React, scoping every repository query to a tenant ID derived from authenticated JWT claims to isolate data between workspaces.
- Added an audit log recording actor identity, action type, and full before/after JSON snapshots for every expense state change (created, updated, submitted, approved, rejected, deleted).
- Integrated Mistral Vision for receipt field extraction, with deterministic guardrails (spend-limit flagging, duplicate checks, category budget alerts) and a heuristic fallback when the AI provider is unavailable.
- Created a standalone CLI tool (ReceiptEvaluator) to run field-accuracy benchmarks against a labeled receipt dataset, backed by 14 xUnit unit tests.

LogiFlow | [Source](#)

Oct 2025 – Jan 2026

Academic Team Project | Primary contributor across server, web, mobile, and final integration

- Developed a freight management platform in Spring Boot and React coordinating orders, dispatching, and delivery workflows across 4 distinct user roles (admin, dispatcher, driver, customer).
- Built real-time GPS location broadcasting over WebSockets, receiving coordinates from the Flutter mobile app and publishing them live to a React Leaflet map for dispatch monitoring.
- Integrated PayPal sandbox checkout for order billing and generated downloadable PDF invoices dynamically from order data using Thymeleaf templates and the iText library.
- Implemented driver execution workflows in Flutter, including live GPS tracking and proof-of-delivery signature capture, and containerized the multi-client system with Docker Compose and GitHub Actions CI.

Technical Skills

Languages: Python, C#, Java, TypeScript, JavaScript, SQL, Dart

Backend & Frameworks: FastAPI, ASP.NET Core, Spring Boot, REST APIs, WebSockets, Celery

Frontend & Mobile: React, Flutter, HTML5/CSS3, Tailwind CSS

Databases & Storage: PostgreSQL, pgvector, Redis, S3/MinIO

Infrastructure & CI/CD: Docker, Google Cloud Run, GitHub Actions

Testing & Tools: Pytest, xUnit, JUnit, Playwright, Vitest, Git, Postman
